

## Visualizing Linear Models: An R Bag of Tricks Session 1: Getting Started

Michael Friendly  
SCS Short Course  
Oct-Nov, 2021

<https://friendly.github.io/VisMLM-course/>

## Today's topics

- What you need for this course
- Why plot your data?
- Data plots
- Model (effect) plots
- Diagnostic plots

2

## What you need

- R, version  $\geq 3.6$ 
  - Download from <https://cran.r-project.org/>
- RStudio IDE, highly recommended
  - <https://www.rstudio.com/products/rstudio/>
- R packages: see course web page
  - car
  - effects
  - heplots
  - candisc
  - visreg

## Why plot your data?

*Getting information from a table is like extracting sunlight from a cucumber. --- Farquhar & Farquhar, 1891*

*Information that is imperfectly acquired, is generally as imperfectly retained; and a man who has carefully investigated a printed table, finds, when done, that he has only a very faint and partial idea of what he has read; and that like a figure imprinted on sand, is soon totally erased and defaced.*

--- William Playfair, *The Commercial and Political Atlas* (p. 3), 1786

3

4

## Cucumbers

Table 7  
Stevens et al. 2006, table 2: Determinants  
of authoritarian aggression

Variable	Coefficient (Standard Error)
Constant	.41 (.93)
Countries	
Argentina	1.31 (.33)**B,M
Chile	.93 (.32)**B,M
Colombia	1.46 (.32)**B,M
Mexico	.07 (.32) <sup>A,CH,CO,V</sup>
Venezuela	.96 (.37)**B,M
Threat	
Retrospective egocentric economic perceptions	.20 (.13)
Prospective egocentric economic perceptions	.22 (.12)*
Retrospective sociotropic economic perceptions	-.21 (.12)*
Prospective sociotropic economic perceptions	-.32 (.12)*
Ideological distance from president	-.27 (.07)**
Ideology	
Ideology	.23 (.07)**
Individual Differences	
Age	.00 (.01)
Female	-.03 (.21)
Education	.13 (.14)
Academic Sector	.15 (.29)
Business Sector	.31 (.25)
Government Sector	-.10 (.27)
R <sup>2</sup>	.15
Adjusted R <sup>2</sup>	.12
N	500

Results of a one model for authoritarian  
aggression

The information is overwhelmed by  
footnotes & significance \*\*stars\*\*

\*\*p < .01, \*p < .05, <sup>A</sup>p < .10 (two-tailed)

<sup>A</sup>Coefficient is significantly different from Argentina's at  
p < .05;

<sup>B</sup>Coefficient is significantly different from Brazil's at p < .05;

<sup>CH</sup>Coefficient is significantly different from Chile's at p < .05;

<sup>CO</sup>Coefficient is significantly different from Colombia's at  
p < .05;

<sup>M</sup>Coefficient is significantly different from Mexico's at p < .05;

<sup>V</sup>Coefficient is significantly different from Venezuela's at  
p < .05.

5

## What's wrong with this picture?

6

## Sunlight

coefplot(model)

Why didn't they say  
this in the first place?

NB: This is a  
presentation graph  
equivalent of the  
table

Shows coefficient  
with 95% CI

7

## Run, don't walk toward the sunlight

8

## Graphs can give enlightenment

*The greatest value of a picture is when it forces us to notice what we never expected to see.*  
-- John W. Tukey

Effect of one rotten point on regression

9

## Dangers of numbers-only output

*Student:* You said to run descriptives and compute the correlation. What next?

*Consultant:* Did you plot your data?

```
X Mean: 54.26
Y Mean: 47.83
X SD : 16.76
Y SD : 26.93
Corr. : -0.06
```

With **exactly** the same stats, the data could be *any* of these plots

See how this is done in R: <https://cran.r-project.org/web/packages/datasauRus/>

10

## Sometimes, don't need numbers at all

COVID transmission risk ~ Occupancy \* Ventilation \* Activity \* Mask? \* Contact.time

A complex 5-way table, whose message is clearly shown w/o numbers

There are 1+ unusual cells here. Can you see them?

Type and level of group activity	Low occupancy			High occupancy		
	Outdoors and well ventilated	Indoors and well ventilated	Poorly ventilated	Outdoors and well ventilated	Indoors and well ventilated	Poorly ventilated
<b>Wearing face coverings, contact for short time</b>						
Silent	Low	Low	Low	Low	Low	Low
Speaking	Low	Low	Low	Low	Low	Low
Shouting, singing	Low	Low	Low	Low	Low	Low
<b>Wearing face coverings, contact for prolonged time</b>						
Silent	Low	Low	Low	Low	Low	Low
Speaking	Low	Low	Low	Low	Low	Low
Shouting, singing	Low	Low	Low	Low	Low	Low
<b>No face coverings, contact for short time</b>						
Silent	Low	Low	Low	Low	Low	Low
Speaking	Low	Low	Low	Low	Low	Low
Shouting, singing	Low	Low	Low	Low	Low	Low
<b>No face coverings, contact for prolonged time</b>						
Silent	Low	Low	Low	Low	Low	Low
Speaking	Low	Low	Low	Low	Low	Low
Shouting, singing	Low	Low	Low	Low	Low	Low

Risk of transmission

Low Medium High

\* Borderline case that is highly dependent on quantitative definitions of distancing, number of individuals, and time of exposure

From: N.R. Jones et al (2020). Two metres or one: what is the evidence for physical distancing in covid-19? *BMJ* 2020;370:m3223, doi: <https://doi.org/10.1136/bmj.m3223>

11

## If you do need tables– make them pretty

Several R packages make it easier to construct informative & pretty semi-graphic tables

Flipper lengths (mm) of the famous penguins of Palmer Station, Antarctica.

Species	Distribution	Female		Male	
		Avg.	Std. Dev.	Avg.	Std. Dev.
ADULE		188	5.6	192	6.6
CHINSTRAY		192	5.8	200	6.0
EMPEROR		213	3.9	222	5.7

Artwork by @allison\_horst

Presentation graph

Perhaps too cute!

Distribution of variables shown

produced using modelsummary::datasummary,  
<https://vincentarelbundock.github.io/modelsummary/articles/datasummary.html>

12

## Visual table ideas: Heatmap shading

**Heatmap shading:** Shade the **background** of each cell according to some criterion

The trends in the US and Canada are made obvious

NB: Table rows are sorted by Jan. value, lending coherence

Background shading ~ value:  
US & Canada are made to stand out.

Tech note: use white text on a darker background

**Unemployment rate in selected countries**  
January-August 2020, sorted by the unemployment rate in January.

country	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug
Japan	2.4%	2.4%	2.5%	2.6%	2.9%	2.8%	2.9%	3.0%
Netherlands	3.0%	2.9%	2.9%	3.4%	3.6%	4.3%	4.5%	4.6%
Germany	3.4%	3.6%	3.8%	4.0%	4.2%	4.3%	4.4%	4.4%
Mexico	3.6%	3.6%	3.2%	4.8%	4.3%	5.4%	5.2%	5.0%
<b>US</b>	<b>3.6%</b>	<b>3.5%</b>	<b>4.4%</b>	<b>14.7%</b>	<b>13.3%</b>	<b>11.1%</b>	<b>10.2%</b>	<b>8.4%</b>
South Korea	4.0%	3.3%	3.8%	3.8%	4.5%	4.3%	4.2%	3.2%
Denmark	4.9%	4.9%	4.8%	4.9%	5.5%	6.0%	6.3%	6.1%
Belgium	5.1%	5.0%	5.0%	5.1%	5.0%	5.0%	5.0%	5.1%
Australia	5.3%	5.1%	5.2%	6.4%	7.1%	7.4%	7.5%	6.8%
<b>Canada</b>	<b>5.5%</b>	<b>5.6%</b>	<b>7.8%</b>	<b>13.0%</b>	<b>13.7%</b>	<b>12.3%</b>	<b>10.9%</b>	<b>10.2%</b>
Finland	6.8%	6.9%	7.0%	7.3%	7.5%	7.8%	8.0%	8.1%

Source: OECD • Get the data • Created with Datarapper

13

## Visual table ideas: Heatmap shading

As seen on TV ...

Covid rate ~ Age x Date x UK region

Better: incorporate geography, not just arrange regions alphabetically

14

## Visual table ideas: Sparklines

**Sparklines:** Mini graphics inserted into table cells or text

From: <https://www.pluralsight.com/guides/tableau-playbook-sparklines>

15

## Linear models

• Model:

$$y_i = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + \dots + \beta_p x_{ip} + \varepsilon_i$$

• Xs: quantitative predictors, factors, interactions, ...

• Assumptions:

- **Linearity:** Predictors (possibly transformed) are linearly related to the outcome,  $y$ . [This just means linear in the **parameters**.]
- **Specification:** No important predictors have been omitted; only important ones included. [This is often key & overlooked.]
- The “holy trinity”:
  - **Independence:** the errors are uncorrelated
  - **Homogeneity of variance:**  $\text{Var}(\varepsilon_i) = \sigma^2 = \text{constant}$
  - **Normality:**  $\varepsilon_i$  have a normal distribution

$$\varepsilon_i \sim_{iid} \mathcal{N}(0, \sigma^2)$$

16

## The General Linear Model

- “linear” models can include:
  - transformed predictors:  $\sqrt{age}$ ,  $\log(income)$
  - polynomial terms:  $age^2$ ,  $age^3$ ,  $poly(age, n)$
  - categorical “factors”, coded as dummy (0/1) variables
    - treated (Yes/No), Gender (M/F/non-binary)
  - interactions: effects of  $x_1$  vary over levels of  $x_2$ 
    - treated  $\times$  age, treated  $\times$  sex, (2 way)
    - treated  $\times$  age  $\times$  sex (3 way)
- Linear model means **linear** in the parameters ( $\beta_i$ ),  

$$y = \beta_0 + \beta_1 age + \beta_2 age^2 + \beta_3 \log(income) + \beta_4 (sex = "F") + \beta_5 age \times (sex = "F") + \epsilon$$
- In R, all handled by `lm(y ~ ...)`

17

## Fitting linear models in R: lm()

- In R, `lm()` for everything
  - Regression models ( $X_1, \dots$  **quantitative**)

```
lm(y ~ X1, data=dat)           # simple linear regression
lm(y ~ X1+X2+X3, data=dat)     # multiple linear regression
lm(y ~ (X1+X2+X3)^2, data=dat) # all two-way interactions
lm(log(y) ~ poly(X,3), data=dat) # arbitrary transformations
```

- ANOVA/ANCOVA models ( $A, B, \dots$  **factors**)

```
lm(y ~ A)                       # one way ANOVA
lm(y ~ A*B)                     # two way: A + B + A:B
lm(y ~ X + A)                   # one way ANCOVA
lm(y ~ (A+B+C)^2)               # 3-way ANOVA: A, B, C, A:B, A:C, B:C
```

18

## Fitting linear models in R: lm()

- Multivariate models: `lm()` with 2+ y vars

- Multivariate regression

```
lm(cbind(y1, y2) ~ X1 + X2 + X3) # std MMreg: all linear
lm(cbind(y1, y2) ~ poly(X1,2) + poly(X2,2)) # response surface
```

- MANOVA/MANCOVA models

```
lm(cbind(y1, y2, y3) ~ A * B) # 2-way MANOVA: A + B + A:B
lm(cbind(y1, y2, y3) ~ X + A) # MANCOVA (equal slopes)
lm(cbind(y1, y2) ~ X + A + X:A) # heterogeneous slopes
```

19

## Generalized Linear Models: glm()

Transformations of  $y$  & other error distributions

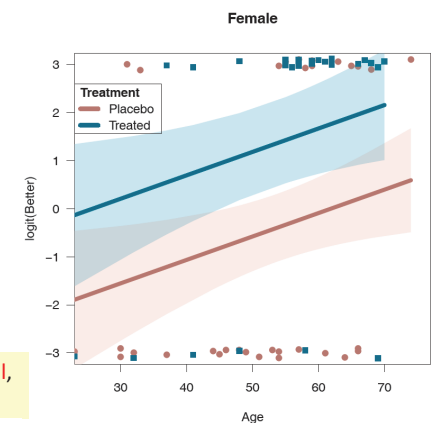

- $y \in (0/1)$ : lived/died; success/fail; ...

- logit (log odds) model:

- $\text{logit}(y) = \log \frac{\Pr(y=1)}{\Pr(y=0)}$
- linear logit model:  

$$\text{logit}(y) = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots$$

```
glm(better ~ age + treat, family=binomial, data=Arthritis)
```

20

## Generalized Linear Models

### Ordinal responses

- Improved  $\in$  ("None" < "Some" < "Marked")
- Models: Proportional odds, generalized logits, ...

```
library(MASS)
polr(Improved ~ Sex + Treat + Age,
     data=Arthritis)

library(nnet)
multinom(Improved ~ Sex + Treat + Age,
         data=Arthritis)
```

21

## Model-based methods: Overview

- models in R are specified by a symbolic model formula, applied to a data.frame
  - `mod<-lm(prestige ~ income + educ, data=Prestige)`
  - `mod<-glm(better ~ age + sex + treat, data=Arthritis, family=binomial)`
  - `mod<-MASS:polr(improved ~ age + sex + treat, data=Arthritis)`
- result (mod) is a "model object", of class "lm", "glm", ...
- method functions:
  - `plot(mod)`, `plot(f(mod))`, ...
  - `summary(mod)`, `coef(mod)`, `predict(mod)`, ...

22

## Plots for linear models

- Data plots:
  - plot response (y) vs. predictors, with smooth summaries
  - scatterplot matrix --- all pairs
- Model (effect) plots
  - plot predicted response ( $\hat{y}$ ) vs. predictors, **controlling** for variables not shown.
- Diagnostic plots
  - Influence plots: leverage & outliers
  - Spread-level plots (non-constant variance?)

23

## R packages

- car
  - Enhanced scatterplots
  - Diagnostic plots
- effects
  - Plot fitted effects of one predictor, controlling all others
- visreg
  - similar to effect plots, simpler syntax
- Both effects & visreg handle nearly all formula-based models
  - `lm()`, `glm()`, `gam()`, `rlm`, `nlme()`, ...

24

## Occupational Prestige data

- Data on prestige of 102 occupations and
  - average education (years)
  - average income (\$)
  - % women
  - type (Blue Collar, Professional, White Collar)

```
> car::some(Prestige, 6)
      education income women prestige census type
architects    15.44  14163   2.69    78.1   2141 prof
physicians     15.96  25308  10.56    87.2   3111 prof
commercial.artists 11.09   6197  21.03    57.2   3314 prof
tellers.cashiers  10.64   2448  91.76    42.3   4133 wc
bakers          7.54   4199  33.30    38.9   8213 bc
aircraft.workers  8.78   6573   5.78    43.7   8515 bc
```

25

## Follow along

The R script ([prestige-ex.R](#)) for this example is linked on the course page. Download and open in R Studio to follow along.

- Examples:
  - Prestige data [prestige-ex.R](#) || [prestige-ex.html](#)
  - Penguin data [penguins-lm-ex.R](#) || [penguins-lm-ex.html](#)

The script was run with 'knitr' (ctrl+shift+K) in R Studio to create the HTML output ([prestige-ex.html](#))

The **Code** button there allows you to download the R code and comments

**Linear models example: Occupational Prestige data**  
Michael Friendly

(These show a simple way to turn R scripts into finished documents)

26

## Informative scatterplots

Scatterplots are most useful when enhanced with annotations & statistical summaries

Data ellipse and regression line show the linear model,  $\text{prestige} \sim \text{income}$

Point labels show possible outliers

Smoothed (loess) curve and CI show the trend

Boxplots show marginal distributions

27

## Informative scatterplots

`car::scatterplot()` provides all these enhancements

```
scatterplot(prestige ~ income, data=Prestige,
  pch = 16,
  regLine = list(col = "red", lwd=3),
  smooth = list(smoother=loessLine,
    lty.smooth = 1, col.smooth = "black",
    lwd.smooth=3, col.var = "darkgreen"),
  ellipse = list(levels = 0.68),
  id = list(n=4, col="black", cex=1.2))
```

Skewed distribution of income & non-linear relation suggest need for a transformation

**Arrow rule:** move on the scale of powers in direction of the bulge  
e.g.:  $x \rightarrow \sqrt{x}$  or  $\log(x)$

28

## Try log(income)

```
scatterplot(prestige ~ income, data=Prestige,
  log = "x",
  pch = 16,
  regLine = list(col = "red", lwd=3),
  ... )
```

Income now ~ symmetric

Relation closer to linear

log(income): interpret as effect of a multiple

29

## Stratify by type?

```
scatterplot(prestige ~ income | type, data=Prestige,
  col = c("blue", "red", "darkgreen"),
  pch = 15:17,
  legend = list(coords="bottomright"),
  smooth=list(smooth=loessLine, var=FALSE, span=1, lwd=4))
```

Formula: | type → “given type”

Different slopes: **interaction** of income \* type

Provides another explanation of the non-linear relation

This may be a new finding!

30

## Scatterplot matrix

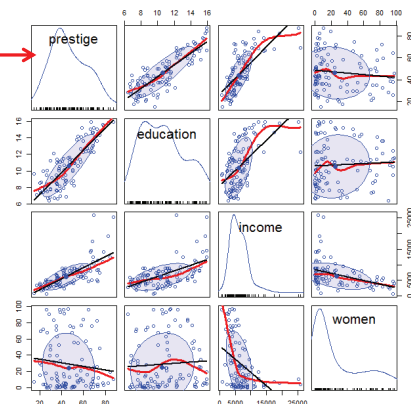

```
scatterplotMatrix(~ prestige + education + income + women,
  data=Prestige,
  regLine = list(method=lm, lty=1, lwd=2, col="black"),
  smooth=list(smooth=loessLine, spread=FALSE,
    lty.smooth=1, lwd.smooth=3, col.smooth="red"),
  ellipse=list(levels=0.68, fill.alpha=0.1))
```

prestige vs. all predictors

diagonal: univariate distributions

- income: + skewed
- %women: bimodal

off-diagonal: relations among predictors

31

## Fit a simple model

```
> mod0 <- lm(prestige ~ education + income + women,
+ data=Prestige)
> summary(mod0)
```

Coefficients:

	Estimate	Std. Error	t value	Pr(> t )
(Intercept)	-6.7943342	3.2390886	-2.098	0.0385 *
education	4.1866373	0.3887013	10.771	< 2e-16 ***
income	0.0013136	0.0002778	4.729	7.58e-06 ***
women	-0.0089052	0.0304071	-0.293	0.7702

Signif. codes: 0 '\*\*\*' 0.001 '\*\*' 0.01 '\*' 0.05 '.' 0.1 ' ' 1

Multiple R-squared: 0.7982 Adjusted R-squared: 0.792  
F-statistic: 129.2 on 3 and 98 DF, p-value: < 2.2e-16

Fits very well

But this ignores:

- nonlinear relation with income: should use log(income)
- occupation type
- possible interaction of income\*type

32

## Fit a more complex model

```
> mod1 <- lm(prestige ~ education + women +
+ log(income)*type, data=Prestige) ← add interaction of log
> summary(mod1) income by type
```

Coefficients:

	Estimate	Std. Error	t value	Pr(> t )
(Intercept)	-152.20589	23.24988	-6.547	3.54e-09 ***
education	2.92817	0.58828	4.978	3.08e-06 ***
women	0.08829	0.03234	2.730	0.00761 **
log(income)	18.98191	2.82853	6.711	1.67e-09 ***
typeprof	85.26415	30.45819	2.799	0.00626 **
typewc	29.41334	36.50749	0.806	0.42255
log(income):typeprof	-9.01239	3.41020	-2.643	0.00970 **
log(income):typewc	-3.83343	4.26034	-0.900	0.37063

---  
Signif. codes: 0 '\*\*\*' 0.001 '\*\*' 0.01 '\*' 0.05 '.' 0.1 ' ' 1

Multiple R-squared: 0.8751, Adjusted R-squared: 0.8654  
F-statistic: 90.07 on 7 and 90 DF, p-value: < 2.2e-16

Fits even better!

But how to understand?

Coefs for type compare mean "wc" and "prof" to "bc"

Coefs for log(income)\*type compare "wc" and "prof" slopes with that of "bc"

33

## Coefficient plots

Plots of coefficients with CI often more informative than tables

```
arm::coefplot(mod0, col.pts="red", cex.pts=1.5)
arm::coefplot(mod1, add=TRUE, col.pts="blue", cex.pts=1.5)
```

This plots raw coefficients, and the Xs are on different scales, so effect of income doesn't appear significant.

34

## Model (effect) plots

- We'd like to see plots of the predicted value ( $\hat{y}$ ) of the response against predictors ( $x_j$ )
  - Ordinary plot of  $y$  vs.  $x_j$  doesn't allow for other correlations
  - Must control (adjust) for other predictors ( $x_{-j}$ ) not shown in a given plot
- Effect plots
  - Variables not shown ( $x_{-j}$ ) are averaged over.
  - Slopes of lines reflect the partial coefficient in the model
  - Partial residuals can be shown also

For details, see `vignette("predictor-effects-gallery", package="effects")`

35

## Model (effect) plots: education

```
library("effects")
mod1.e1 <- predictorEffect("education", mod1)
plot(mod1.e1)
```

This graph shows the partial slope for education, controlling for all others

For each ↑ year in education, fitted prestige ↑2.93 points, (other predictors held fixed)

36

## Model (effect) plots

```
mod1.e1a <- predictorEffect("education", mod1, residuals=TRUE)
plot(mod1.e1a,
     residuals.pch=16, id=list(n=4, col="black"))
```

Partial residuals show the residual of prestige controlling for other predictors

Unusual points here would signal undue influence

## Model (effect) plots: women

```
mod1.e2 <- predictorEffect("women", mod1, residuals=TRUE)
plot(mod1.e2, ylim=c(40, 65), lwd=4,
     residuals.pch=16)
```

Surprise!

Prestige of occupations ↑  
with % women (controlling  
for other variables)

Another 10% women ↑  
prestige by 0.88 points

How to interpret this?

## Model (effect) plots: income

```
plot(predictorEffect("income", mod1,
                    lines=list(multiline=TRUE, lwd=3),
                    key.args = list(x=.7, y=.35)))
```

Income interacts with type in the model

The plot is curved because log(income) is in the model

Curvature reflects marginal effect of income for each occupation type

## visreg plots: Air quality data

Daily air quality measurements in New York, May - Sep 1973

How does Ozone concentration vary with solar radiation, wind speed & temperature?

```
> head(airquality)
  Ozone Solar.R Wind Temp Month Day
1   41    190   7.4  67    5    1
2   36    118   8.0  72    5    2
3   12    149  12.6  74    5    3
4   18    313  11.5  62    5    4
5   NA     NA  14.3  56    5    5
6   28     NA  14.9  66    5    6
```

see: <https://pbreheny.github.io/visreg/> for examples & details

## Air quality: main effects model

```
> fit1 <- lm(Ozone ~ Solar.R + Wind + Temp, data=airquality)
> summary(fit1)
```

Coefficients:

	Estimate	Std. Error	t value	Pr(> t )
(Intercept)	-64.3421	23.0547	-2.79	0.0062 **
Solar.R	0.0598	0.0232	2.58	0.0112 *
Wind	-3.3336	0.6544	-5.09	1.5e-06 ***
Temp	1.6521	0.2535	6.52	2.4e-09 ***

---  
Signif. codes: 0 '\*\*\*' 0.001 '\*\*' 0.01 '\*' 0.05 '.' 0.1 ' ' 1

Residual standard error: 21.18 on 107 degrees of freedom  
(42 observations deleted due to missingness)  
Multiple R-squared: 0.6059, Adjusted R-squared: 0.5948  
F-statistic: 54.83 on 3 and 107 DF, p-value: < 2.2e-16

41

## visreg conditional plots

```
visreg(fit1, "Solar.R")
visreg(fit1, "Wind")
visreg(fit1, "Temp")
```

model summary =  
predicted values (line) +  
confidence band (uncertainty) +  
partial residuals (objections)

## Factor variables & interactions

```
airquality$Heat <- cut(airquality$Temp, 3,
  labels=c("Cool", "Mild", "Hot"))
```

```
# fit model with interaction of Wind * Heat
fit2 <- lm(Ozone ~ Solar.R + Wind*Heat, data=airquality)
visreg(fit2, "Wind", by="Heat", layout=c(3,1), points=list(cex=1))
```

43

## Factor variables & interactions

```
visreg(fit2, "Wind", by="Heat",
  overlay=TRUE,
  gg=TRUE,
  points=list(size=2)) +
  theme_bw()
```

**overlay=TRUE** → superpose panels  
**gg=TRUE** → uses ggplot

This allow slope for Wind to vary with Heat e.g., Wind has no effect when Cool

This model still assumes **linear** effects of Heat & Wind

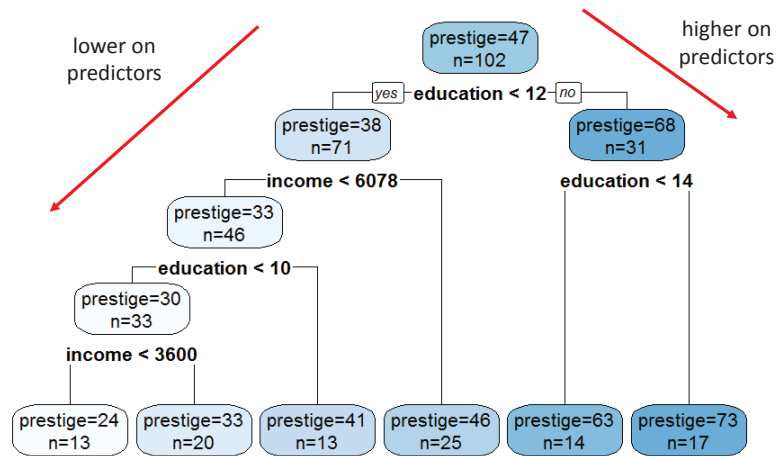

44

## Prestige data: rpart tree

```
rpart.plot(rmod, prefix="prestige=")
```

49

## Diagnostic plots

- The linear model,  $y = X\beta + \epsilon$  assumes:
  - Residuals,  $\epsilon_i$  are normally distributed,  $\epsilon_i \sim N(0, \sigma^2)$
  - (Normality not required for  $X$ s)
  - Constant variance,  $\text{Var}(\epsilon_i) = \sigma^2$
  - Observations  $y_i$  are statistically independent
- Violations  $\rightarrow$  inferences may not be valid
- A variety of plots can diagnose all these problems
- Other methods (boxCox, boxTidwell) diagnose the need for transformations of  $y$  or  $X$ s.

50

## The “regression quartet”

In R, plotting a `lm` model object  $\rightarrow$  the “regression quartet” of plots

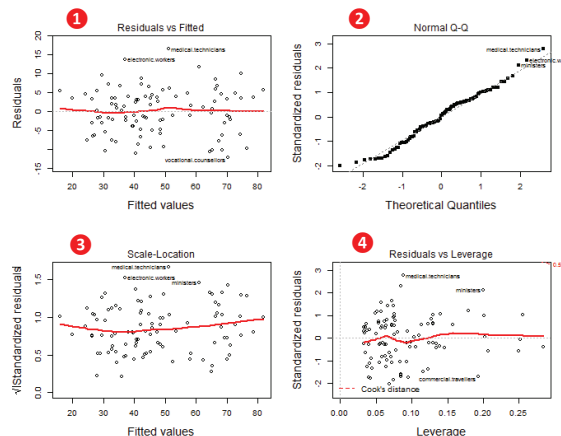

```
plot(mod1, lwd=2, cex.lab=1.4)
```

1 Residuals: should be flat vs. fitted values

2 Q-Q plot: should follow the 45° line

3 Scale-location: should be flat if constant variance

4 Resids vs. leverage: can show influential observations

51

## Unusual data: Leverage & Influence

- “Unusual” observations can have dramatic effects on least-squares estimates in linear models
- Three archetypal cases:
  - Typical  $X$  (low leverage), bad fit -- Not much harm
  - Unusual  $X$  (high leverage), good fit -- Not much harm
  - Unusual  $X$  (high leverage), bad fit -- **BAD, BAD, BAD**
- Influential observations: unusual in *both*  $X$  &  $Y$
- Heuristic formula:

Influence =  $X$  leverage  $\times$   $Y$  residual

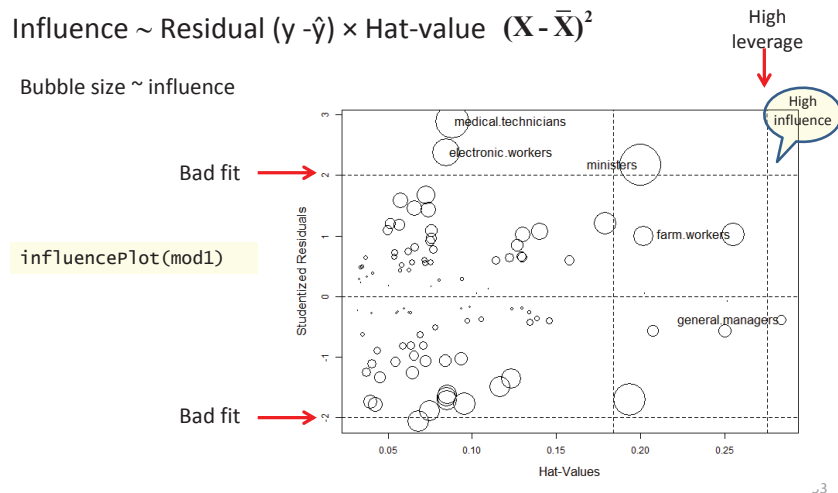

52

## Influence plots

Influence (Cook's D) measures impact of individual obs. on coefficients, fitted values

$$\text{Influence} \sim \text{Residual } (y - \hat{y}) \times \text{Hat-value } (X - \bar{X})^2$$

Bubble size  $\sim$  influence

## Spread-level plots

- To diagnose non-constant variance, plot:

- log |Std. residual| vs. log (x)
- log (IQR) vs log (median) [for grouped data]

- If  $\approx$  linear w/ slope b, transform  $y \rightarrow y^{(1-b)}$

Artificial data, generated so  $\sigma \sim x$

- $b \approx 1 \rightarrow \text{power} = 0$
- $\rightarrow$  analyze  $\log(y)$

## Spread-level plot: baseball data

Data on salary and batter performance from 1987 season

```
data("Baseball", package="vcd")
bb.mod <- lm(sal87 ~ years + hits + runs + homeruns, data=Baseball)
spreadLevelPlot(bb.mod, pch=16, lwd=3,
  id=list(n=2))
```

## Suggested power transformation: 0.2609

slope = .74  $\rightarrow$  p = .26

i.e.,  $y \rightarrow \log(y)$  or  $y^{1/4}$

NB: both axes plotted on log scale

## Box Cox transformation

- Box & Cox proposed to transform  $y$  to a power,  $y \rightarrow y^{(\lambda)}$  to minimize the residual SS (or maximize the likelihood)

- Makes  $y^{(\lambda)}$  more nearly normal
- Makes  $y^{(\lambda)}$  more nearly linear in with X

Formula for  $y^{(\lambda)}$

- $y^{(0)} : \log_e(y)$
- $\lambda < 0$ : flip sign to keep same order

$$y_i^{(\lambda)} = \begin{cases} \frac{y_i^\lambda - 1}{\lambda} & \text{if } \lambda \neq 0, \\ \ln(y_i) & \text{if } \lambda = 0, \end{cases}$$

Power(p)	Transformation	Name
2	$Y^2$	Square
1	Y (No transformation)	Original Data
$\frac{1}{2}$	$\sqrt{Y}$	Square root
0	$\log Y$ or $\log_{10}(Y)$	Logarithm
$-\frac{1}{2}$	$-1 / \sqrt{Y}$	Reciprocal Root
-1	$-1 / Y$	Reciprocal
-2	$-1 / Y^2$	Reciprocal Square

## Example: Cars93 data

How does gas mileage (MPG.city) depend on vehicle weight?

```
> cars.mod <- lm(MPG.city ~ Weight, Cars93)
> coef(cars.mod)
(Intercept)      Weight 
  47.04835      -0.00803
```

Relationship clearly non-linear

**Tukey arrow rule:** transform Y (or X)  
as arrow thru the curve bulges  
 $y \rightarrow \sqrt{y}, \log(y), 1/y$   
 $x \rightarrow \sqrt{x}, \log(x), 1/x$

58

## MASSextra package

```
> library(MASSextra)
> box_cox(cars.mod) # plot log likelihood vs. lambda
> lambda(cars.mod)
[1] -1.26
```

The plot of  $-\log(L) \sim \text{RSS}$  shows the minimum & CI

plot(bc(MPG.city, lambda(cars.mod)))

59

## Summary

- Tables are for look-up; graphs can give insight
- “Linear” models include so much more than ANOVA & regression
- Data plots are more effective when enhanced
  - data ellipses → strength & precision of correlation
  - regression lines and smoothed curves
  - point identification → noteworthy observations
- Effect plots show informative views of models
  - Visualize conditional effects, holding others constant
- Diagnostic plots can reveal influential observations and need for transformations.
